# Using the Aggregate() Method

Aggregate() Method

- Aggregate(seed value, function(accumulator variable, row)
  - Iterate over a collection and accumulate a single value
  - Supply a seed value to set the accumulator variable
  - Supply a function to accept two variables
    - 1st parameter = Accumulator variable
    - 2nd parameter = Each row from collection
  - Lambda expression to put result into accumulator variable

- Aggregate() samples
